

Graffiti Removal Systems Pty Ltd ABN: 48 079 733 163
Official Provider Melbourne 2006 Commonwealth Games
Keeping Australia Clean & Green

As graffiti vandalism escalates daily, there are opportunist general chemical companies that are claiming they have developed a range of "graffiti remover chemicals to solve every ones problems in 1 magic bottle"
They all usually contain very aggressive, borderline solvents that have little regard for the environment, often create more damage to the affected substrate, require twice the amount of water and chemical to remove the graffiti and are offered at a heavily discounted price.

These companies also manufacture a broad range of other products including janitorial chemicals, lubricants, insecticides, pesticides, soaps, degreasers etc.

THEY DO NOT SPECIALISE IN ANY ONE AREA!!!!

They do not offer the on-going support of full training, on-site assessments, community engagement, education processes or a help-line.

Trusted performance chemicals with proven results are your best friends when it comes to rapid graffiti removal on your assets and infrastructure.

Graffiti Removal Systems since 2002 has endeavoured and continually strives to provide the latest technologies in chemicals for SAFE and ENVIRONMENTALLY SUSTAINABLE practices when dealing with this SPECIALISED field of cleaning.

The results and our performance over the last 8 years and into the future have proven this to be the case.

With the support of over 30 Victorian Councils, Government, Large Corporations and over 200 Schools, we guarantee to give you the best possible results without damage to the substrates.

Next time you are approached with these new "wonder products", ask the following:

1. Will they remove aniline dyes?
2. Will they remove printer's inks?
3. Will they remove raven oil?
4. Will they remove "ironlak" spray cans
5. Will they remove cold galv zinc metal primer?
6. Will they remove flow pens?
7. Will they remove spray ink?
8. Will they remove line marking paint?
9. Do they contain xylene?
10. Do they contain N-methyl pyrrolidine?
11. Do they contain Toluene?
12. Do they contain Iso propanol?
13. Do they contain IMS?

1 All of the points 9 to 12 are know carcinogens.
Are they biodegradable?

Please feel free to contact us to arrange a free demonstration of our products on any of your infrastructure and let us show you why we know our products are the best in the market.
